In classical field theories, the Lagrangian specification of the flow field is a way of looking at fluid motion where the observer follows an individual fluid parcel as it moves through space and time. Plotting the position of an individual parcel through time

When allowing the grid to move as in the vertical Lagrangian?remap method, motion of fluid elements and thus the transport of fluid properties are measured relative to the moving grid. This transport is the dia?surface transport detailed mathematically in section D0.4. If the grid lines are fixed, as in an Eulerian method, then advective ...

A flexible and versatile method which contains the advantages of both Lagrangian and Eulerian approaches to solving compressible flows was developed. The method moves the grid so that it is required to be Lagrangian in only one coordinate direction. This flexibility permits the use of an adaptive grid scheme in other directions.

We would like to note that in a Lagrangian scheme the velocity at each side of x_i used here should be the relative fluid velocity, that is, $u_{i-\frac{1}{2}}$ and $u_{i+\frac{1}{2}}$, where $u_{i-\frac{1}{2}} = M_{i-\frac{1}{2}}$, $u_{i+\frac{1}{2}} = M_{i+\frac{1}{2}}$ and x_i is the cell boundary's reference moving velocity which can be numerically determined as the Roe average $\frac{1}{2}(u_{i-\frac{1}{2}} + u_{i+\frac{1}{2}})$.

This thesis presents our work related to (i) Lagrangian schemes and (ii) Arbitrary-Lagrangian-Eulerian numerical methods (ALE).
